Introducing EnrollHub365 — Intelligent Access Management for Windows 365 Cloud PC

Date: March 21, 2026

What is EnrollHub365?

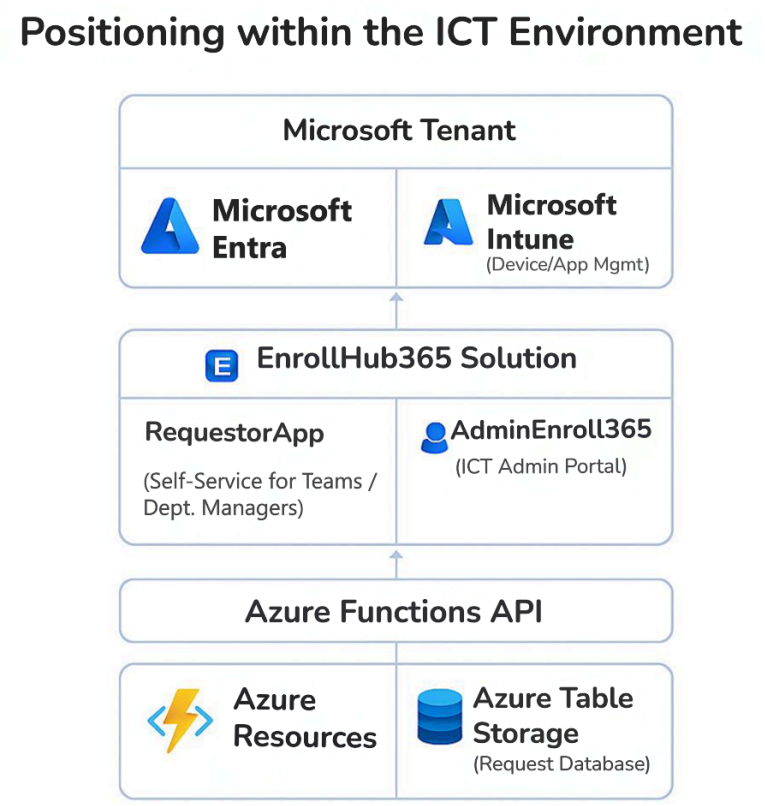
EnrollHub365 is a is a cloud-native self-service enrollment management solution built entirely on the **Microsoft Azure** and **Microsoft 365** platform. It automates and governs the lifecycle of user access to **Windows 365 Cloud PCs** or **Azure Virtual Desktops**— from initial enrollment requests through scheduled activation and controlled revocation — all in a structured, auditable, and secure manner.

Designed for organizations that rely on Microsoft's modern workplace infrastructure, EnrollHub365 fits seamlessly within your existing **Microsoft Entra ID (Azure AD)**, **Microsoft Intune**, and **Azure** environment, requiring no third-party infrastructure.

Beyond core enrollment management, EnrollHub365 can integrate with **Azure Logic Apps** and **Azure Automation** to automate downstream processes. This enables scenarios such as triggering cross-system workflows or adding approved users to external applications through governed automation.

Positioning Within the Client's ICT Environment

EnrollHub365 operates as a **logic and orchestration tier** that sits between your existing Microsoft cloud services for supporting self services:



EnrollHub365 **does not replace** any Microsoft service. Instead, it adds a structured governance and automation layer on top of them, making it a natural extension of your current Microsoft cloud investment.

The solution also supports **job profiles** to enforce role-based environment setup. With predefined profiles (for example, **Frontline Workers**, **Developer** or a **Casual User**), each user receives the right baseline of groups, policies, and tooling aligned to their function.

Core Components

The solution consists of three integrated components:

1. 🔵 Deploy365 — Backend API (Azure Function App)

The intelligence engine of the solution, built in **C# on .NET 8** and hosted as an **Azure Function App**. It handles:

- All business logic for enrollment, revocation, and scheduling
- Secure communication with **Microsoft Graph API** (Entra ID, Intune)
- Role-based authorization (User, Approver, Manager, Admin, System)
- Data persistence via **Azure Table Storage**
- A well-defined REST API consumed by both front-end portals

2. 🟢 AdminEnroll365 — Administrator Portal (Blazor WebAssembly)

A modern, responsive web application for IT administrators, providing:

- Full oversight of all **Enroll Groups** (Windows 365 Cloud PC assignment groups in Entra ID / Intune)
- Management of **access requests** across all groups and users
- A **scheduler view** to oversee planned enrollments and revocations
- **Analytics & statistics** — request counts, trends, and group activity
- **Security oversight** — compliance monitoring across group access
- Creation and management of new Enroll Groups directly from the portal

3. 🟡 RequestorEnroll365 — Self-Service Requestor Portal (Blazor WebAssembly)

A lightweight self-service portal for **group owners** (e.g., team leads, department managers), enabling them to:

- View the Enroll Groups they own
- Submit **new access requests** for members or guests
- Schedule the **enrollment date** and optionally a **revocation date**
- Add justification notes per request
- Track the status of their submitted requests

Enrollment & provisioning are driven by Intune group configuration

EnrollHub365 does not hardcode or define the actual workplace configuration a user receives (apps, compliance policies, configuration profiles, conditional access alignment, etc.). Instead, enrollment and downstream provisioning behavior relies entirely on the **target environment configuration as defined in Microsoft Intune and its related group assignments**. EnrollHub365's role is to govern and orchestrate the request, approval, scheduling, and audit trail—while the effective end-state configuration is determined by how the environment's Intune groups (and linked policies/apps) are set up.

Key Functionalities

Feature	Description
Automated Enrollment	Schedules and automates the provisioning of Windows 365 Cloud PC access to users on a defined date
Scheduled Revocation	Automatically revokes access on a pre-defined date, removing manual follow-up tasks
Enroll Group Management	Creates and manages Entra ID / Intune groups dedicated to Cloud PC assignment
Role-Based Access Control	Five role levels (User, Approver, Manager, Admin, System) aligned with Entra ID
Request Lifecycle Tracking	Full status history per request (New → Enrolled / Failed / Expired / Cancelled / Revoked)
Self-Service for Group Owners	Group owners can submit and manage requests without IT intervention
Analytics & Reporting	Overview of request volumes, trends, and group statistics for management reporting
Security & Compliance	Managed Identity authentication, minimal-permission design, and full audit trail
Azure-Native Deployment	100% hosted on Azure — no on-premise components, no third-party dependencies
Logic Apps & Automation Integration	Connects enrollment events to Azure Logic Apps and Azure Automation runbooks for end-to-end process orchestration across internal and external systems
Job Profile-Based Provisioning	Applies predefined role profiles (e.g., Developer, Casual User) so each user receives the correct environment configuration by default

---

Technology & Security

- **Platform:** Microsoft Azure (.NET 8, Azure Functions, Blazor WebAssembly, Azure Table Storage)
- **Identity & Access:** Microsoft Entra ID (Azure AD) with MSAL, Managed Identity
- **API Security:** OAuth 2.0 / Azure AD token-based authorization on every API call
- **Deployment:** Azure Static Web Apps (front-end), Azure Function App (backend), supports CI/CD via GitHub Actions or Azure DevOps
- **Monitoring:** Application Insights, Azure Monitor alerts, permission audit logs

---

Who Is This For?

EnrollHub365 is ideal for organizations that:

- Have adopted or are rolling out **Windows 365 Cloud PC /Azure Virtual Desktops**
- Want to **automate and control** who gets access, when, and for how long
- Would like to make the Enrollment of Virtual Desktop **accessible for managers or teams**
- Need a **structured approval and request process** without adding IT workload
- Require an **audit trail** for access governance and compliance
- Are working within a **Microsoft-first** cloud strategy (Azure / Microsoft 365)

Why EnrollHub365?

> "Instead of manual processes, spreadsheets, or ad-hoc IT tickets to manage Cloud PC access, EnrollHub365 provides a governed, automated, and auditable workflow — fully embedded in your existing Microsoft cloud environment."

- ✅ **No new infrastructure** — runs entirely in your Azure tenant
- ✅ **Minimal permissions** — designed with a least-privilege security model
- ✅ **Self-service** — empowers group owners while keeping IT in control
- ✅ **Scalable** — handles multiple groups, environments (W365 Enterprise, W365 Business, etc.), and hundreds of concurrent requests
- ✅ **Future-ready** — multi-language support planned, extensible architecture
