EnrollHub365 — Solution Introduction

> *Confidential | For interested parties only*
> Date: March 21, 2026

What is EnrollHub365?

EnrollHub365 is a self-service enrollment management solution built natively on **Microsoft Azure**. It empowers teams, department managers, and IT administrators to manage digital workplace access, assigning licenses or access control — including Microsoft Entra ID groups and Microsoft Intune device/app policies — through a structured, controlled, and fully auditable request process.

Rather than routing every access request through the ICT service desk, EnrollHub365 brings the power of enrollment management directly to the people who need it, in a governed and secure way.

In addition to core enrollment workflows, EnrollHub365 can orchestrate process automation across other Azure services using its own work and approval process engines or by including **Azure Logic Apps** , **Azure Automation** or other **Azure resources**. This enables downstream actions such as triggering approval workflows, running runbooks, or provisioning users in external applications when an enrollment event is approved.

Integrations with other Azure resources (governance, monitoring, and downstream provisioning)

In addition to it own process and logging engines for / Entra / Intune enrollment workflows, **EnrollHub365 is designed to integrate with other Azure resources** to extend security controls, operational monitoring, and downstream automation .

Typical integration building blocks include for instance:

- **Azure Logic Apps** — event-driven orchestration across Microsoft and non-Microsoft systems (connectors, approvals, notifications, data enrichment).
- **Azure Automation** — controlled execution of administrative runbooks (for example PowerShell-based tasks, scheduled jobs, remediation actions).
- **Azure Key Vault** — secure storage of secrets/certificates used for external SaaS APIs and automation accounts to ensure that sensitive information stays in Azure.
- **Service Bus / Storage Queues** — reliable asynchronous processing for high-volume or long-running provisioning tasks.

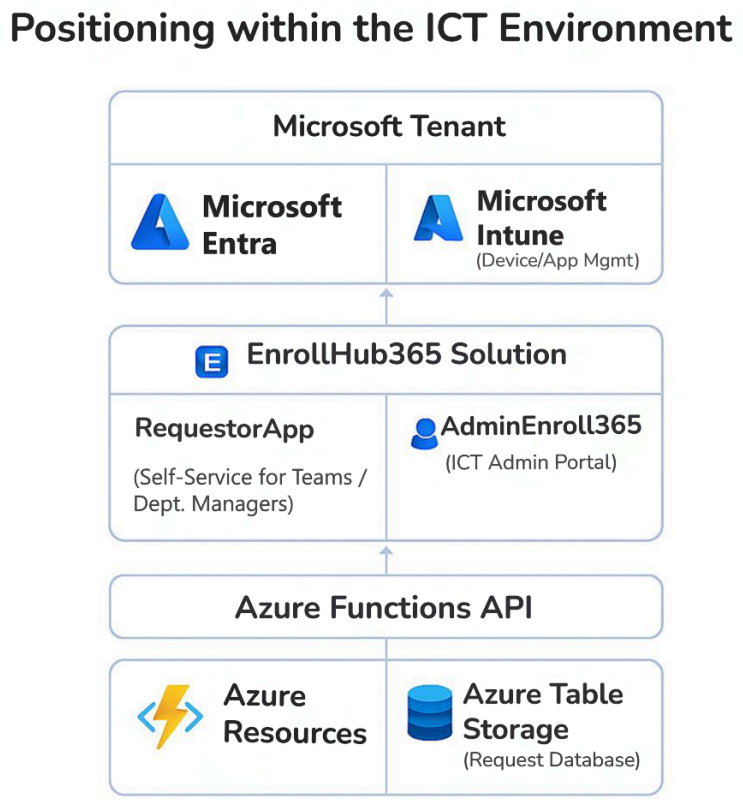
Example: secured provisioning to an external SaaS health web application
When an enrollment request is approved (for example, adding a clinician to a specific role/group), EnrollHub365 can trigger a **Logic App** or **Automation runbook** that:

1. Validates preconditions (user attributes, license state, MFA/CA compliance, request metadata).
2. Provisions or updates the user in the external SaaS health application via its API (create account, assign roles, map organization/unit).
3. Writes provisioning results back to the EnrollHub365 audit trail and/or a centralized log store (Log Analytics).
4. Raises alerts on failure or policy violations (for example, missing compliance requirements), enabling ICT/SecOps follow-up.

This pattern ensures external SaaS provisioning is **controlled, traceable, and monitorable**, rather than being a “silent” background action without governance.

Positioning within the ICT Environment

EnrollHub365 sits at the intersection of **Identity & Access Management (IAM)**, **Modern Workplace**, and **IT Service Management** within a Microsoft 365 tenant.



EnrollHub365 acts as a **governed bridge** between business users and ICT, integrating directly with:

- **Microsoft Entra ID (Azure AD)** — for identity, group management, and authentication (MSAL support)
- **Microsoft Intune** — for workplace and device enrollment group management
- **Azure Functions** — as the secure API backbone
- **Azure Table Storage** — as the default scalable request database
- **Azure Logic Apps** — for event-driven integration and cross-system workflow orchestration
- **Azure Automation** — for scripted operational tasks and runbook-based process automation

Authentication is fully handled through **Microsoft Entra ID**, meaning no separate accounts are required — users sign in with their existing corporate identity, with **modern authentication support**.

The solution also supports **job profiles** to apply role-aligned workplace configurations. With job profiles, organizations can predefine the right environment for user types such as a **developer** (for example: elevated tooling groups and development policies) versus a **casual user** (for example: standard productivity access), improving consistency and reducing manual administration. The Database defaults to a Table storage but can also, on request, configurated to use other DBMS systems like **SQL** or **Azure Postgress**

Enrollment & provisioning are driven by Intune group configuration

EnrollHub365 does not hardcode or define the actual workplace configuration a user receives (apps, compliance policies, configuration profiles, conditional access alignment, etc.). Instead, enrollment and downstream provisioning behavior relies entirely on the **target environment configuration as defined in Microsoft Intune and its related group assignments**. EnrollHub365's role is to govern and orchestrate the request, approval, scheduling, and audit trail—while the effective end-state configuration is determined by how the environment's Intune groups (and linked policies/apps) are set up.

The Two Portals

EnrollHub365 consists of two dedicated web applications, each targeting a specific user role:

Portal	Target User	Primary Purpose
RequestorApp (`RequestorEnroll365`)	Team leads, department managers, HR, administrative staff	Self-service enrollment requests for their own groups
AdminEnroll365	ICT members / administrators	Full oversight, group management, request

Portal	Target User	Primary Purpose
		processing, analytics

Main Functionalities

RequestorApp — Self-Service for Managers & Teams

- **My Workplaces Groups** — Overview of all Enroll365 groups for which the logged-in user is a designated EnrollHub365 Owner
- **Create New Enrollment Request** — Submit access requests for internal members, guest users, or external parties
- **User Search** — Search for users within the organization (members or guests) to enroll
- **Scheduled Enrollment** — Define a future *Enroll On Date* so access is automatically activated on the right date
- **Scheduled Revocation** — Optionally define a *Revoke On Date* to automatically remove access and licensing after a specific period (e.g., temporary contractor access)
- **Request on Behalf Of** *(configurable)* — Managers or support staff can create requests on behalf of another team member
- **Job Profile Selection** *(configurable)* — Select a predefined profile (for example, Frontline worker, Casual Enterprise User or Developer) so the correct access baseline and licenses is applied during enrollment
- **View All Requests** — Per group, the requestor can track all submitted requests and their statuses
- **Real-time Status Tracking** — Requests move through clear statuses: Pending → Enrolled → Revoked / Failed / Expired

AdminEnroll365 — ICT Administration Portal

- **Enroll Groups Overview** — Full dashboard of all Enroll365 groups across the organization, with member counts, owner information, environment type (Production / Test / Dev), and pre-aggregated request statistics
- **Request Management** — View, filter, sort, and process all enrollment requests across all groups
- **Create & Manage Requests** — Admins can create or modify requests on behalf of any user, and assign a custom requestor identity
- **Group Owner Management** — Add or remove Enroll365 owners to a group; track whether owners were added via the application or directly in Entra
- **Analytics & Statistics** — Track request counts per group over configurable time windows (default: 12 months), with breakdowns by status (Completed, Needs Attention, Error)

- **Schedule Management** — Full oversight of upcoming enrollments and revocations
- **Security Oversight** — Compliance monitoring, with clear visual status indicators for all requests
- **Create New Enroll Groups** — Multi-step form to create new Enroll365 groups by linking existing Entra/Intune groups and assigning owners and configuration
- **Job Profile Governance** — Define and maintain role-based profile mappings so each user persona receives the correct environment and licenses by default

---

Request Status Lifecycle

Requests in EnrollHub365 follow a transparent lifecycle, giving full visibility at every stage:

```
Submitted → Pending → Processing → Enrolled ✅
                                 → Failed ❌
                                 → Expired ⏳
                                 → PendingRevoke → Revoked ✅
                                                 → RevocationFailed ❌
                                 → Cancelled 🚫
```

All statuses are visually communicated through clear icons and color coding in both portals.

Scenarios

📘 Scenario Set A — RequestorApp: Department Manager / Team Lead

Scenario A1 — Onboarding a New Internal Team Member

> **Context:** A department manager is onboarding a new full-time employee and needs to give them access to the team's Microsoft 365 workplace (Teams, SharePoint, Intune managed apps).

Steps in the RequestorApp:

1. The manager logs in with their corporate Microsoft 365 account.
2. On the **home page**, they first select the relevant **Request Type** (for example: *New Enrollment* / *Request User Workplace*).
3. They navigate to **My Workplaces Groups** and see all groups for which they are an owner.

4. They select the relevant group (e.g., *"Marketing – Digital Team"*).
5. They search for the new employee by name or email in the user search field.
6. They set the **Enroll On Date** to the employee's start date.
7. They add an optional note (e.g., "New hire – starting 01/04/2026").
8. They review and submit the request.
9. The new employee is automatically enrolled in the group on the defined start date.

Result: Zero ICT tickets. The manager handles onboarding independently.

Scenario A2 — Granting Temporary Access to an External Consultant

> **Context:** A project manager needs to grant a guest/external consultant temporary access to a project workspace for 3 months.

Steps in the RequestorApp:

1. The manager logs in with their corporate Microsoft 365 account.
2. On the **home page**, they first select the relevant **Request Type** (for example: *Guest Enrollment* / *Request External User*).
3. They navigate to the relevant project group (via **My Workplaces Groups**).
4. They select **Guest User** as the user type.
5. They enter the guest's email address manually (for new guest accounts).
6. They set:
   - **Enroll On Date:** Today (immediate)
   - **Revoke On Date:** 3 months from today

Result: The consultant gains access immediately and is automatically removed after 3 months — no manual follow-up required by the manager or ICT.

Scenario A3 — Monitoring Team Enrollment Status

> **Context:** A team lead wants to check the status of all access requests for their group.

Steps in the RequestorApp:

1. They navigate to **My Workplaces Groups**.
2. They click **View All Requests** on the relevant group card.
3. They see a filtered view of all requests for that group with clear status indicators:
   - ✅ Enrolled
   - ⏳ Pending

- ❌ Failed
- ⏳ Expired

Result: Full transparency on team access without needing to contact ICT.

🛡️ Scenario Set B — AdminEnroll365: ICT Member as Administrator

Scenario B1 — Setting Up a New EnrollHub365 Group

> **Context:** A new project team requires a dedicated enrollment group connected to an existing Entra/Intune group.

Steps in AdminEnroll365:

1. The ICT admin navigates to **Enroll Groups**.
2. They click **Create New Enroll Group** and follow the multi-step wizard:
   - **Step 1:** Search for and select an existing Entra/Intune group.
   - **Step 2:** Select and assign admin users / group owners.
   - **Step 3:** Configure environment type (Windows 365 Cloud PC types. Azure Virtual Desktop or other usages)
   - **Step 4:** Review and confirm.
3. The group is assigned to EnrollHub365 and immediately visible in the RequestorApp for assigned owners.

Result: A new self-service group is live in minutes, with the correct governance configuration.

Scenario B2 — Monitoring and Processing Enrollment Requests

> **Context:** An ICT admin wants to review all pending and failed requests across the organization.

Steps in AdminEnroll365:

1. They navigate to **Requests**.
2. Using **Advanced Filtering**, they filter by status = *"Needs Attention"* or *"Error"*.
3. They click into a specific request to view full details.
4. They can view each process step in a workflow diagram style with the logged actions to see what failed
5. They can:

- Manually update the request status
- Test the specific Request step
- Add internal notes
- Trigger a retry or cancel the request

Result: ICT has full control and visibility over all enrollment activity across the tenant.

Scenario B3 — Managing Group Owners

> **Context:** An ICT admin needs to add a new department manager as an owner of an enrollment group, so the manager can use the RequestorApp for their team.

Steps in AdminEnroll365:

1. They navigate to **Enroll Groups** and locate the target group.
2. They open the group detail panel and go to **Owner Management**.
3. They search for the new manager by name or email.
4. They add the manager as an EnrollHub365 owner. The system records:
   - Who added the owner
   - When they were added
   - Via which method (Application or Entra)
5. The new owner can immediately log into the RequestorApp and manage enrollments.

Result: Controlled, auditable delegation of self-service capability to business users.

Scenario B4 — Compliance Check: Reviewing Scheduled Revocations

> **Context:** An ICT security officer wants to verify that all temporary access grants have proper revocation dates and none have been missed.

Steps in AdminEnroll365:

1. They navigate to **Requests** and filter by status = *"PendingRevoke"* or *"Enrolled"* with a revocation date set.
2. They review all upcoming revocations scheduled within the next 30 days.
3. They verify that no access grants are open-ended that should be temporary.
4. For any anomalies, they can directly update the revocation date or cancel the request.

Result: Continuous compliance enforcement without manual spreadsheet tracking.

Scenario B5 — Automated SaaS provisioning with security checks (Logic Apps + Automation)

> **Context:** ICT wants approved enrollment in Entra/Intune to also create/maintain access in an external SaaS health web application.

Admin actions:

1. Configure an integration workflow (Logic App and/or Automation runbook) that is triggered on **Approved / Enrolled** events.
2. Enforce security gates (for example: only proceed if the user is in the correct Entra groups, meets compliance requirements, and has the required attributes).
3. Store SaaS URI's and API secrets in Key Vault and use managed identities where possible.

Result: Every approved enrollment can automatically create/update the SaaS user **with consistent security enforcement and full auditability**.

Scenario B6 — Adding extra governance steps for high-risk enrollments (Logic Apps approvals / validations)

> **Context:** Certain enrollments (for example, access to clinical systems or sensitive data scopes) require additional approvals or checks.

Admin actions:

1. Route specific request types through an additional approval step using the EnrollHub365 Approval step in the workflow (for example, security officer approval) or by using Logic Apps.
2. Validate conditions (time window, requester role, training completion flag, attestation) before allowing downstream provisioning.
3. Automatically deny or quarantine requests that violate policy and notify stakeholders.

Result: Stronger governance for privileged/sensitive access while keeping the process automated and auditable.

Why EnrollHub365?

Challenge	EnrollHub365 Solution
ICT overwhelmed by routine access requests	Self-service RequestorApp for managers

Challenge	EnrollHub365 Solution
Temporary access left open indefinitely	Built-in scheduled revocation
No visibility into who has access to what	Full request audit trail with status tracking
Ad-hoc guest user onboarding	Structured guest enrollment with defined lifecycle
Manual group owner management	Admin portal with auditable owner assignment
Lack of compliance oversight	Real-time analytics and status monitoring for ICT
Multiple tools needed for access management	Single platform, fully integrated with Microsoft 365

EnrollHub365 is developed on the Microsoft Azure & Microsoft 365 platform. Authentication is handled exclusively via Microsoft Entra ID — no additional credentials required.

For more information or a demo, please reach out to the EnrollHub365 team.
